

# Resource access reports

Resource access covers the transfer of users to resources.

These statistics are based on a user being transferred to a resource as part of an authentication / authorisation event. They cannot show what the user did on that publisher's site, and because they can only record the transfer to the resource when the resource sends the user to us as part of a sign-in, they might not match up exactly with what a publisher reports - for example their stats might also include IP authorised users. Because of this, some sites take the view that IP auth should be disabled.

Common elements are described on the [data explorer](#) page.

Any report you generate can be [saved](#) or [scheduled](#), very useful if you have a lot of data that won't fit on the screen.

Scope	This organisation All organisations
Granularity	Hourly Daily Monthly

## Breakdowns

By resource - the resources accessed.

By group - the user groups assigned to users who were transferred to resources. Not available across organisations.

By permission set - the permission sets assigned to users who were transferred to resources. Not available across organisations. Permission sets are reported whether or not they contain the resource in question.

By location (coming soon) - the countries that the users were in when they were transferred to the resource.

By custom attribute - any custom attribute you have added to your schema and marked as reportable.

These breakdowns can be viewed for all resources or a single resource by selecting a resource from the dropdown at the top of the page or clicking on a resource name on the all resources view.

## Secondary breakdown

If you select resource as the breakdown, you will be presented with an option to select an additional breakdown - e. g. permission set, group or any reportable attribute. As this can make the interface a little crowded, downloading the report may be helpful.
