

OASP Legacy documentation

OpenAthens SP is our installable SAML Service Provider software. It has been designed to work within a SAML federation but can also connect to many other Identity Provider solutions.

The software is available in three flavours. Apache (via RPM), Java and .NET. These instructions will assume you are comfortable in your chosen environment and concentrate on matters specific to OpenAthens SP. Primary pages will be aimed at the advanced user and link off to extra information for the intermediate user for those areas you are not so familiar with.
